

[Chapter 3: Proteins - Fill-in-the-Blank Question Bank]

1. The repeating sequence of atoms along the core of a polypeptide chain is called the _____.
2. Proteins are polymers of _____ linked together by peptide bonds.
3. The unique, defining feature of an amino acid is its _____.
4. Amino acids with negatively charged side chains, like aspartic acid and glutamic acid, are classified as _____ amino acids.
5. The end of a polypeptide chain with a free amino group is called the _____.
6. The final folded structure of a protein is stabilized by a large number of weak _____ bonds.
7. The clustering of nonpolar side chains in the interior of a protein is driven by the _____ force.
8. The process of unfolding a protein from its native state is called _____.
9. Special proteins that assist in the proper folding of other proteins are known as _____.
